GHISARREDO
6 LIGHT AND DESIGN

FILOSOFIA

La cura dei manufatti e l'abbinamento con la tecnologia led, rendono i nostri prodotti la soluzione ideale per arredare ed illuminare con efficienza aree residenziali ed urbane.

La conoscenza dei differenti materiali impiegati ed una progettazione

attenta alle diverse necessità di mercato, permettono

di poter soddisfare differenti esigenze e gusti stilistici,

dal più moderno e minimalista

al più nostalgico e classico.

The care of the products
and the combination with LED technology
make our products the ideal solution to efficiently furnish
and lighting residential and urban areas.

The knowledge of the different materials and the
attentive design to the different needs of the market, allow to meet different
needs and stylistic tastes, from the most modern and minimalist to the most nostalgic and classic.

Ghisarredo ha un'esperienza pluriennale nella progettazione e produzione di dispositivi per l'arredo, illuminazione pubblica e residenziale.

Ai cablaggi e portalamпада tradizionali si aggiunge l'alta tecnologia Led che rende i nostri prodotti tra le migliori scelte in termini qualitativi e di risparmio energetico.

Ghisarredo has many years of experience in the design and production of devices for public and residential lighting. In addition to traditional lamp holder and wiring, we supply high Led technology that makes our products one of the best choices in terms of quality and energy savings.

Una selezione di eleganti pali e bracci in acciaio anodizzato,
consentono di scegliere una perfetta illuminazione
degli spazi verdi, urbani, piazze e quartieri.

A selection of elegant anodized steel poles and arms,
allow you to choose a perfect lighting of green,
urban spaces, squares and neighborhoods.

In condizioni ambientali molto sfavorevoli, le flange di base e le parti del palo interrato sono esposte agli effetti aggressivi di composti di sale, ammoniaca e danni meccanici. Per un'ulteriore protezione da corrosione nella parte inferiore della colonna, vi è la possibilità di coprire la piastra di base, compresi i fori per i bulloni di montaggio e una parte di palo laminata fino a 350 mm con

Elastomero poliuretano.

Lo spessore del rivestimento protettivo rientra nell'intervallo da 0,7 mm a 1 mm con una durezza di circa 90° SH. La superficie dell'elastomero è trattata con una vernice resistente ai raggi UV, simile al colore del rivestimento anodico della colonna. **La protezione dell'elastomero è conforme alle norme EN-40 ovvero i requisiti europei per i pali di illuminazione in alluminio.**

Under very unfavorable environmental conditions, the base flanges and parts of the buried post are exposed to the aggressive effects of salt compounds, ammonia and mechanical damage. For further corrosion protection in the lower part of the column, there is the possibility of covering the base plate, including the holes for the mounting bolts and a laminated pole part up to 350 mm with **Polyurethane elastomer**. The thickness of the protective coating falls within the range from 0.7 mm to 1 mm with a hardness of about 90°SH. The elastomer surface is treated with a UV-resistant paint, similar to color of the anodic coating of the column.

The elastomer protection complies with EN-40 standards or the European requirements for aluminum lighting poles.

Per quanto riguarda i requisiti di sicurezza previsti dai produttori di pali d'illuminazione per ridurre al minimo il pericolo derivante dagli incidenti stradali, sono stati effettuati test di sicurezza passivi sui nostri prodotti secondo la norma EN 12767 "Sicurezza passiva delle strutture di supporto per le attrezzature stradali. Requisiti e metodi di prova". Come risultato dei test si è ottenuto il certificato di costanza di performance per pali d'illuminazione in alluminio in altezze da 2 a 12 m:

- SAL e MAL da ø114 a ø225 mm con muratura
- SAL da ø114 a ø180 mm con piastra di base

In base ai requisiti della norma EN 12767:2019, i pali presentano proprietà funzionali in termini di sicurezza passiva quando vengono colpiti da un veicolo con una classificazione di:

100-NE-C-S-SE-MD-0 (100 NE2 secondo EN 12767:2007).

I pali d'illuminazione in alluminio con classe di sicurezza passiva 100NE2 possono essere utilizzati in un'infrastruttura stradale, dove il fattore di assorbimento non energetico è richiesto per le costruzioni stradali, ad es. autostrade, vie esposte, strade di campagna. In caso di collisione con palo d'illuminazione, l'auto continuerà a proseguire ad una velocità ridotta e gli effetti dell'incidente saranno ridotti al minimo.

As regards the safety requirements established by the manufacturers of lighting poles to minimize the danger deriving from road accidents, passive safety tests have been carried out on our products according to the EN 12767 standard "Passive safety of support structures for road equipment. Requirements and test methods ". As a result of the tests, the certificate of constancy of performance was obtained for aluminum lighting poles in heights from 2 to 12 m:

- SAL and MAL from ø114 to ø225 mm with masonry
- SAL from ø114 to ø180 mm with base plate

According to the requirements of EN 12767: 2019, poles exhibit functional properties in terms of passive safety when struck by a vehicle with a classification of:

100-NE-C-S-SE-MD-0 (100 NE2 according to EN 12767: 2007).

The aluminum lighting poles with passive safety class 100NE2 can be used in a road infrastructure, where the non-energy absorption factor is required for road construction, eg. motorways, expressways, country roads. In the event of a collision with a lighting pole, the car will continue at a reduced speed and the effects of the accident will be minimized.
